Lead-Free by CEC

Calumet Electronics is offering Lead-Free PCB Solutions.

Calumet Electronics Corp. announces the expansion of its printed circuit board solutions to include meet growing demand for content restricted electronics. Calumet has been a leading manufacturer of printed circuit boards in the USA for over 35 years. Quality, performance, and dependability are the core elements of the organization.

A commitment to continuous improvement includes developing products and capabilities that meet the demands of the marketplace. The growing interest in printed circuit boards that meet pending European Union Directives has been met with a certifiable program of compliance. The process included Vendor polling for content disclosure of all raw materials, internal processing evaluation and testing, and independent Lab verification.

The need for lead-free solder joints has been met with the acquisition of a new automatic, chemical process line from Integrated Process Systems (www.ips-vcm.com) and industry leading chemistry by Uyemura International Corporation (www.uyemura.com) to provide Electroless nickel/immersion gold and Immersion silver surface coating alternatives to our standard horizontal, hot air leveled tin/lead solder.

“Lead-Free alternatives will have a significant impact on the industry” commented Stephen J. Marshall, National Sales Manager, “We are not only committed to providing products that conform, but working toward providing a better understanding of the impact of conformance throughout the supply chain”.
